- Containers:
    - Docker is an open platform for developing, shipping & running applications.
    - Containers are light-weight OS.
- *docker ps -a*
    - List all the containers
- *docker images*
    - List all the images
- *docker run --name <container name> -d -p <host port>:<container port>*
    - Create the container and run it
    - *-d*: run in background
    - Container also requires a port. Let a node.js application is there where we have mentioned **app.listen(3000)** it means it'll listen in side the container only.
    - So, for even a single application, the container requires a port.
- *docker inspect <container id or container name>*
    - Display the container details along with its port details.
- *docker compose up -d*
    - Create and start containres
- *docker compose down -d*
    - Stop and remove containers
- *docker system prune*
    - Delete the unused containers.
